1. Problem Statement

Sesha is developing a weather monitoring system for a region with multiple weather stations. Each weather station collects temperature data hourly and stores it in a 2D array.

Write a program that can add the temperature data from two different weather stations to create a combined temperature record for the region.

Input Format

The first line of input consists of two space-separated integers N and M, representing the number of rows and columns of the matrices, respectively.

The next N lines consist of M space-separated integers, representing the values of the first matrix.

The following N lines consist of M space-separated integers, representing the values of the second matrix.

Output Format

The output prints the addition of the two matrices in N rows and M columns, representing the combined temperature record.

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 3 3

1 2 3

4 5 6

7 8 9

1 1 1

2 2 2

3 3 3

Output: 2 3 4

6 7 8

10 11 12

Answer

```
// You are using Java
import java.util.*;
class Temp{
    public static void main(String [] args){
        Scanner myobj = new Scanner(System.in);
        int n1 = myobj.nextInt();
        int n2 = myobj.nextInt();
        int[][] Bucket1 = new int[n1][n2];
        int[][] Bucket2 = new int[n1][n2];
        int[][] Bucket3 = new int[n1][n2];
        for(int i=0; i<n1; i++){
            for(int j=0; j<n2; j++){
                Bucket1[i][j] = myobj.nextInt();
            }
        }
